

The Hydrus[®] Microstent

is a revolutionary therapy used during cataract surgery to help manage your glaucoma. It has been proven in global clinical trials to **lower eye pressure**, which resulted in a reduction of glaucoma medicine and, in some patients, **eliminated the need for medication**.¹

of Hydrus Microstent patients saw a significant reduction in eye pressure¹

of all patients with a Hydrus Microstent were drop free at 2 years¹

Before scheduling cataract surgery, here are 3 things to know:

- 1 The Hydrus Microstent is for adult patients undergoing cataract surgery who have mild to moderate primary open-angle glaucoma, a common type of glaucoma.
- 2 The Hydrus Microstent is a minimally invasive device that is placed during cataract surgery to help manage your glaucoma. This less invasive approach allows for fewer complications and faster healing times than traditional glaucoma surgery.
- 3 Although you won't be able to feel the Hydrus Microstent once it's implanted, you'll know soon how well it is working for you. In the weeks following your procedure, your doctor will test to determine if the pressure in your eye has been adequately lowered.

CAUTION: Federal law restricts this device to sale by or on the order of a physician.

INDICATIONS FOR USE: The Hydrus Microstent is indicated for use in conjunction with cataract surgery for the reduction of intraocular pressure (IOP) in adult patients with mild to moderate primary open-angle glaucoma (POAG). **CONTRAINDICATIONS:** The Hydrus Microstent is contraindicated under the following circumstances or conditions: (1) In eyes with angle closure glaucoma; and (2) In eyes with traumatic, malignant, uveitic, or neovascular glaucoma or discernible congenital anomalies of the anterior chamber (AC) angle. **PRECAUTIONS:** The surgeon should monitor the patient postoperatively for proper maintenance of intraocular pressure. If the intraocular pressure is not controlled, the surgeon may recommend appropriate medication or other treatment. The safety and effectiveness of use of more than a single Hydrus Microstent has not been established. The Hydrus Microstent has not been established as an alternative to the primary treatment of glaucoma with medications. **ADVERSE EVENTS:** Common post-operative adverse events reported in the randomized pivotal trial included partial or complete device obstruction (7.3%); worsening in visual field MD by > 2.5 dB compared with preoperative (4.3% vs 5.3% for cataract surgery alone); device malposition (1.4%); and BCVA loss of ≥ 2 ETDRS lines ≥ 3 months (1.4% vs 1.6% for cataract surgery alone). For additional adverse event information, please refer to the Instructions for Use. **MRI INFORMATION:** The Hydrus Microstent is MR-Conditional meaning that the device is safe for use in a specified MR environment under specified conditions. **Ask your doctor for complete product information.**

Delivering A New Confidence

**MANAGING
YOUR GLAUCOMA
MAY BE EASIER THAN
YOU IMAGINED**

UNDERSTANDING GLAUCOMA

Glaucoma is a common eye disease that occurs due to increased pressure in the eye caused by a buildup of excess fluid. Treatment is aimed at lowering pressure to prevent further loss of vision.

NORMAL
FLUID
DRAINAGE

Healthy Eye

In a healthy eye, a fluid called *aqueous humor* flows freely throughout the eye and travels through an internal drainage system.

BLOCKED
FLUID
DRAINAGE

Glaucoma

If the drainage system is blocked or partially obstructed, the natural pressure in your eye may increase. When eye pressure becomes too high, the optic nerve can become damaged causing blurred vision, severe eye and head pain, and, if left untreated, vision loss or blindness.

TALK TO YOUR DOCTOR TO SEE IF
THE HYDRUS MICROSTENT
IS RIGHT FOR YOU.

TREATING GLAUCOMA IN A UNIQUE WAY

Hydrus Microstent

Roughly the size of an eyelash, the highly flexible Hydrus Microstent is placed by a surgeon during cataract surgery using microscopic incisions and advanced equipment. This less invasive approach allows for fewer complications and faster healing times than traditional glaucoma surgery.

*Actual size is much, much smaller.

Hydrus Microstent helps to
reduce eye pressure in 3 ways:

- 1 ENHANCING OUTFLOW**
Hydrus Microstent is placed in Schlemm's canal, a part of the drainage system of the eye. Fluid then flows through the Hydrus Microstent and into the eye's natural outflow channel to reduce eye pressure.
- 2 EXPANDING THE EYE'S NATURAL FLUID PATHWAY**
Hydrus Microstent delicately expands Schlemm's canal, allowing for enhanced flow through the eye's drainage system.
- 3 REDUCING PRESSURE RELIABLY**
Hydrus Microstent spans a full 90° within the eye. This coverage ensures that fluid reaches the eye's drainage system, which carries fluid from Schlemm's canal to the body's circulatory system and allows pressure in the eye to be lowered reliably.
